

## **VIMAR solutions for the Hospitality industry**

Vimar stands out by offering solutions for the hospitality industry comprising systems designed to offer the very best in terms of comfort, safety, control, energy efficiency and matching styling.

Evolving in step with architectural and domestic styles while working closely with designers constitutes the starting block to delivering the perfect combination of design and technology.

The goal is to establish a solid partnership with customers, forming a lasting relationship which offers practical and clear benefits for the hotel owner/manager, the installer, and guests themselves, who can appreciate the comfort and safety of every detail.

Vimar can therefore be relied on as a sole supplier, a veritable team of professionals capable of providing support and customised, global solutions for automating, connecting and monitoring the entire accommodation facility, ensuring totally matching styling for the visible devices.

The Vimar solution manages lights, curtains, temperature, security, energy and accesses while offering functionality and comfort in every single environment under the hallmark of style and technology Made in Italy; it is designed to **automate** an unlimited number of guest rooms and supervise them **directly from the reception desk computer**, centrally controlling all the other areas of the hotel.

Integration with third-party hotel management software (PMS) makes it possible to share information and allows the system to manage the room in a variety of ways, for instance enabling a welcome scenario (which differs between night and day), managing lights, temperature and automatic curtains. The system is also integrated with technological systems, such as air conditioning, heating and air recirculation, creating innovative and user-friendly solutions for energy control and management, while at the same time reducing energy costs.

There is ample room for customisation on the Eikon, Linea, Arké and Plana wiring series: special finishes, countless colour combinations for cover plate and buttons, purpose-devised symbols, associated with controls and engraved logos on the cover plate.

Every project is studied from preliminary design to prototyping and production, and all aspects are analysed to identify the right solution to meet the requirements and pair styling with needs. The lighting device therefore becomes an interface that connects intensively with the infrastructure, making a style choice that reflects the personality of the building. The customised materials and finishes are complemented by laser engraving the controls, buttons and cover plates, choosing from a wide range of symbols or the customer's identification logo.

All without losing sight of the commitment to integrate environmental, social and economic sustainability in the world of architecture. These are key topics for VIMAR, who has always been focused on finding increasingly innovative low impact solutions – from the choice of raw materials to resource management – in the knowledge that the road to a sustainable future is paved with constant daily commitment.
